

## **IN THE CLAIMS:**

1. (Currently Amended) A built-in self-test controller, comprising:
  - a built-in self-test engine configured to execute a built-in self-test and ~~generating~~ generate an indication of whether the executed built-in self-test is completed; and
  - a built-in self-test signature including the indication, wherein the built-in self-test engine includes:
    - a logic built-in self-test engine; and
    - ~~the built-in self-test signature includes~~ a logic built-in self-test signature[[,]]; and wherein the built-in self-test controller is configured to:
      - enter a reset state;
      - enter an initiate state entered from the reset state upon receipt of a logic built-in self-test run signal;
      - scan a scan chain responsive to entering the initiate state;
      - step to a new scan chain; and
      - repeat the previous scanning and stepping until the content of a pattern generator in the logic built-in self-test engine of the built-in self-test controller equals a predetermined vector count.
2. (Cancelled).
3. (Previously Presented) The built-in self-test controller of claim 1, wherein the logic built-in self-test engine comprises:
  - a logic built-in self-test state machine; and
  - a pattern generator.
4. (Cancelled).

5. (Original) The built-in self-test controller of claim 1, wherein the logic built-in self-test signature comprises the content of a multiple input signature register.
6. (Previously Presented) The built-in self-test controller of claim 1, wherein the built-in self-test engine includes a memory built-in self-test engine and the built-in self-test signature includes a memory built-in self-test signature.
7. (Cancelled).
8. (Amended) The built-in self-test controller of claim 6, wherein the memory built-in self-test signature includes a bit indicating whether a memory built-in self-test is done.
9. (Previously Presented) The built-in self-test controller of claim 6, wherein the memory built-in self-test engine comprises:  
a memory built-in self-test state machine; and  
a nested memory built-in self-test engine operating the memory built-in self-test state machine.
10. (Currently Amended) The built-in self-test controller of claim 9, wherein the memory built-in self-test state machine is configured to:  
enter a reset state entered upon receipt of an external reset signal;  
enter an initiate state entered from the reset state upon receipt of at least one of a  
memory built-in self-test run signal and a memory built-in self-test select  
signal;  
enter a flush state entered from the initiate state upon the initialization of  
components and signals in ~~the~~ a memory built-in self-test domain in the  
initiate state;  
enter a test state entered into from the flush state; and  
enter a done state entered into upon completing the test of each of a plurality of  
memory components in the memory built-in self-test domain.
11. (Previously Presented) The built-in self-test controller of claim 9, wherein the memory built-in self-test engine comprises:

a plurality of alternative memory built-in self-test state machines; and  
a nested memory built-in self-test engine operating a predetermined one of the  
memory built-in self-test state machines.

12. (Currently Amended) The built-in self-test controller of claim 11, wherein each of  
the memory built-in self-test engines is configured to:

enter a reset state entered upon receipt of an external reset signal;

enter an initiate state entered from the reset state upon receipt of at least one of a  
memory built-in self-test run signal and a memory built-in self-test select  
signal;

enter a flush state entered from the initiate state upon the initialization of  
components and signals in the memory built-in self-test domain in the  
initiate state; a test state entered into from the flush state; and

enter a done state entered into upon completing the test of each of a plurality of  
memory components in the memory built-in self-test domain.

13. (Cancelled).

14. (Cancelled).

15. (Cancelled).

16. (Cancelled).

17. (Previously Presented) An integrated circuit device, comprising:

a plurality of memory components;

a logic core;

a testing interface; and

a built-in self-test controller, including:

a memory built-in self-test engine configured to execute a built-in self-test  
on one of the memory components and the logic core and storing

the results thereof, wherein the results include an indication of whether an executed built-in self-test is completed; and  
a memory built-in self-test signature register capable of storing the results of an executed built-in self-test, including the indication;

and wherein the built-in self-test controller includes a logic built-in self-test engine configured to:

enter a reset state;  
enter an initiate state entered from the reset state upon receipt of a logic built-in self-test run signal;  
scan a scan chain responsive to entering the initiate state;  
step to a new scan chain; and  
repeat the previous scanning and stepping until the content of a pattern generator in the logic built-in self-test engine of the built-in self-test controller equals a predetermined vector count.

18. (Previously Presented) The integrated circuit device of claim 17, wherein the logic built-in self-test engine includes a multiple input signature register.
19. (Cancelled).
20. (Original) The integrated circuit device of claim 17, wherein the memory components include a static random access memory device.
21. (Original) The integrated circuit device of claim 17, wherein testing interface comprises a Joint Test Action Group tap controller.
22. (Currently Amended) A method for performing a built-in self-test, the method comprising:

performing a built-in self-test, wherein performing the built-in self-test includes performing a logic built-in self-test including:  
resetting a logic built-in self-test engine;

initiating a plurality of components and signals in a built-in self-test controller upon receipt of a logic built-in self-test run signal;  
scanning a scan chain upon the initialization of the components and the signals;  
stepping to a new scan chain;  
repeating the previous scanning and stepping until the content of a pattern generator in a the logic built-in self-test engine of the built-in self-test controller equals a predetermined vector count;  
generating an indication of whether the logic built-in self-test is completed; and  
storing the indication, wherein storing the indication includes setting a bit in a multiple input signature register.

23. (Cancelled).

24. (Cancelled).

25. (Previously Presented) The method of claim 22, further comprising at least one of:

setting a bit in the multiple input signature register indicating an error condition arose; and

setting a bit in the multiple input signature register indicating whether the stored results are from a previous logic built-in self-test run.

26. (Original) The method of claim 22, wherein performing the built-in self-test includes performing a memory built-in self-test and storing the indication includes setting a bit in a memory built-in self-test signature register.

27. (Original) The method of claim 26, wherein performing the memory built-in self-test includes:

resetting a memory built-in self-test engine;

initiating a plurality of components and signals in a built-in self-test controller upon receipt of at least one of a memory built-in self-test run signal and a memory built-in self-test select signal;

flushing the-contents of a plurality of memory components to a known state after initialization of the components and the signals; and testing the flushed memory components.

28. (Previously Presented) The method of claim 26, wherein performing the memory built-in self-test further includes storing the results of the memory built-in self-test in the memory built-in self-test signature register.

29. (Cancelled).

30. (Cancelled).

31. (Cancelled).

32. (Cancelled).
